

Senseless.uk

Google Ads & Merchant Centre audit

Website, catalogue, structured data and advertising mechanisms
Research snapshot: 20 September 2026

Main conclusion: the public product data is substantially coherent: 17 products have 22 variant-level Offers, and their schema prices and stock states match the public Shopify catalogue. The strongest confirmed concerns are contradictory strength positioning and problematic returns wording. Product classification, missing identifiers and any old Merchant Centre records need targeted investigation.

Scope and confidence

The final technical pass fetched all 17 current product pages, the public catalogue, and delivery, returns, FAQ and system pages. Earlier checks in this conversation covered the homepage, robots rules and selected application content. Official Google and UK government guidance informs the causal analysis. This was a public-site audit, without Merchant Centre, Google Ads, Shopify admin, Search Console or checkout access.

Evidence level	What the report can establish
Confirmed	Current catalogue counts, offer markup, observed copy and stated delivery/returns terms.
Risk requiring evidence	Regulatory category; whether existing GTINs are omitted from feeds; how Google interprets shipping markup.
Account-only questions	Old listings, source conflicts, disapproval reasons, campaign inclusion, spend, conversion accuracy and suspension status.

Priority order

- 1. Resolve classification and claims:** numbing and procedure-specific claims must match the actual formulation and supporting documentation.
 - 2. Correct returns language:** distinguish voluntary returns from statutory UK consumer rights.
 - 3. Reconcile Merchant Centre:** compare processed listings against the 22 current variants.
 - 4. Validate identifiers and variants:** check missing GTINs and selected landing-page behaviour.
 - 5. Confirm shipping and measurement:** test actual checkout charges and a complete consent-aware purchase journey.
- No inherited allegation:** the earlier report of many old Merchant Centre products concerned Totally Numb. It is not evidence that Senseless has the same problem. This report explains exactly how to identify it and how it would affect ads if present.

2 Catalogue and schema findings

Confirmed: 22 individual Offers match public catalogue data

All 17 product pages contain Product markup with populated descriptions. Across their 22 Offers, every parsed price and InStock state matched the corresponding Shopify variant, and offer URLs included the appropriate variant ID. No AggregateOffer pricing structure was found in those Product records. All 22 variants were available in the public data at capture; this is not a physical-stock audit. [W1]

Example	Offer-level data
Advanced Cream	10g: S10AD, £24.99; 30g: S30AD, £49.99. Separate variant URLs and Offers.
Clinical Gel	15ml: S15CL, £19.99; 35ml: S35CL, £34.99. Separate variant URLs and GTINs.
Advanced Starter	One kit variant, SBUN3, £84.99. Validate any feed sale-price treatment against the current customer price.

Identifier gaps: investigate, do not invent barcodes

Three Offers contain gtin13 values; all three have 13 digits and pass numerical check-digit validation. Nineteen Offers omit GTINs: the bag, ointment pack, five kits, three sprays, four Advanced/Professional gel variants and five cream variants. Omission is not automatically an error: determine whether a valid manufacturer-assigned GTIN exists for each exact retail unit. Public schema does not reveal what the feed submits. Verify assignment and ownership; never fabricate identifiers or mark identifier_exists false just to suppress a warning. [G3]

Variant identity can be made clearer

Multi-size pages place the first/default SKU at Product level while listing different sizes under separate Offers. Clinical Gel also places the 15ml GTIN on the parent Product. That is less explicit than modelling each size as its own Product within ProductGroup. Review against Google variant guidance and validate the selected-size destination. This is a modelling concern, not an observed price mismatch or proven disapproval. Selected-variant page rendering was not fully tested. [G4]

Shipping and returns markup

Schema includes standard £1.99, express £3.99 and next-working-day £8.99 services, plus free standard from £40 and free next-day from £80. The public delivery page broadly agrees. Thresholds are encoded using eligibleTransactionVolume: do not assume Google consumes that property merely because it exists. Validate supported markup and configure Merchant Centre shipping rules directly. Checkout totals were not tested. [W4, G5]

Return schema declares a GB 30-day return window with customer-paid return postage. This captures the general policy but not all exceptions in the page wording. Align supported structured data, Merchant Centre settings and actual customer rights. [W5, G5]

3 Current catalogue reference

Public Shopify snapshot; prices in GBP. Each size is a separate variant. Use this 22-variant baseline to reconcile Merchant Centre; feed IDs can differ from Shopify IDs, so join by SKU plus exact product/size and URL. [W1]

Product	Size / option	SKU	Price
Clinical Strength Cream	10g	S10CL	£19.99
Clinical Strength Cream	30g	S30CL	£44.99
Advanced Strength Cream	10g	S10AD	£24.99
Advanced Strength Cream	30g	S30AD	£49.99
Professional Strength Cream	30g	S30PR	£55.99
Clinical Strength Gel	15ml	S15CL	£19.99
Clinical Strength Gel	35ml	S35CL	£34.99
Advanced Strength Gel	15ml	SG15AD	£24.99
Advanced Strength Gel	35ml	SG35AD	£39.99
Professional Strength Gel	15ml	SG15PR	£29.99
Professional Strength Gel	35ml	SG35PR	£44.99
Clinical Strength Spray	35ml	SSPCL	£19.99
Advanced Strength Spray	35ml	SSPAD	£24.99
Professional Strength Spray	35ml	SSPPR	£29.99
Foaming Cleanser	35ml	SFOAM	£19.99
Clinical Starter	Single item	SBUN1	£71.99
Clinical Ultimate	Single item	SBUN2	£107.99
Advanced Starter	Single item	SBUN3	£84.99
Advanced Ultimate	Single item	SBUN4	£120.99
Professional Ultimate	Single item	SBUN5	£135.99
Vitamin A & D Ointment (4 Pack)	Single item	VAD-4PK	£2.00
Senseless Cosmetics Bag	Single item	SENBAG	£9.99

All variants returned available=true. There are five two-size products: Clinical and Advanced creams, and Clinical, Advanced and Professional gels. Professional cream has one 30g variant. Kits have separate product records for Starter/Ultime where offered.

4 Claims, trust and policy exposure

Confirmed contradiction: strength versus comfort scale

The system page describes selection by strength, presents progressively demanding use cases, and simultaneously says the named tiers are not a measure of strength. Advanced Cream likewise combines a strength-labelled title and higher-strength positioning with the comfort-scale disclaimer. Establish what actually differs between formulas and use one substantiated explanation across pages, packaging, feeds and ad assets. The contradiction is confirmed; an actual Google enforcement decision is not. [W2, W3]

Numbing claims create a material classification question

Senseless describes itself as cosmetic and CPSR-assessed while recommending numbing preparation for injections, microneedling, tattoos and other procedures. The system page says formulation details are on packaging and in regulatory documents. Obtain the exact ingredients, concentrations, intended purpose, safety assessment and classification rationale for each formula; a cosmetic assessment alone does not settle medicinal classification. MHRA considers both presentation and function, including implied claims. [W3, W6, R1]

Google Ads and Shopping have separate healthcare restrictions. If a product falls within a restricted medicine category, wording changes alone do not make it eligible. UK Shopping requirements for OTC medicines include pharmacy registration/certification conditions. Establish the actual category before choosing an approval route. No finding that Senseless is an unauthorised medicine is made here. [G6, G7]

Returns page: correct statutory-rights presentation

The page excludes sale items, requires unopened/original packaging, states refunds within 10 working days, and frames a 14-day cooling-off period as an additional right for prospective EU customers. UK distance buyers also generally have cancellation rights, subject to specific exceptions; sale purchases retain statutory rights. A valid sealed-hygiene exception is narrower than an unrestricted exclusion of all opened goods. Clarify the voluntary 30-day policy, statutory cancellation/refund deadlines and faulty-item rights separately, including for the cosmetics bag. [W5, R2]

This is a confirmed wording concern and potential trust/policy risk, not evidence of denied refunds or a Merchant Centre suspension. Google misrepresentation review can consider the overall business and customer-policy presentation. [G8]

Procedure targeting, testimonials and product claims

The system/FAQ promotes injectable and invasive cosmetic procedures. Google sensitive-health audience restrictions may therefore matter for remarketing and Customer Match; this does not ban all Search or PMax advertising. Review actual policy labels. Check support for efficacy, duration and antibacterial claims, and ensure inherited reviews concern the same product/formula. Do not remove authentic reviews merely to disguise the product's intended effect. [W3, W6, G9]

Positive findings: customer contact details, business identity and delivery information are visible; the inspected FAQ and Professional Spray instructions specify unbroken skin. No sitewide AdsBot block was observed. These positives do not independently establish full policy compliance.

5 Exactly how this can affect Google Ads

Mechanism	Advertising consequence and proof needed
Old approved item remains included	Shopping/PMax can advertise its submitted title, image, price and URL. A stale destination can waste clicks or reduce conversion. Prove with item-level eligibility, campaign inclusion, impressions, clicks and cost. [G10, G11]
Feed and destination disagree	Wrong price, size or stock can trigger item disapproval; wider problems can trigger warnings or pre-emptive disapprovals. This removes eligible product-ad opportunities. Compare processed attributes with the exact variant page. [G1]
Automatic updates read website data	Google can correct supported price/availability/condition fields. This is not a full catalogue replacement and does not reliably retire obsolete product identities. Check item update history. [G2]
Restricted claims or product category	A product may be disapproved; account-level Merchant Centre enforcement can affect Shopping across the catalogue. Read the actual issue code and level of enforcement before diagnosing the cause. [G6-G8]
Missing or incorrect identifiers	If an assigned GTIN is required, an omitted or wrong value can cause data issues and constrain eligibility/performance. Schema omission alone does not prove a feed violation. Inspect processed GTIN and issue codes. [G3]
New IDs after a catalogue migration	Old records may persist and item-ID filters may miss replacement products. Historical item reporting becomes fragmented. This does not mean all campaign learning resets. [G12]

PMax has two relevant routes to old content

First, included Merchant Centre products supply their own product URLs. Turning Final URL expansion off does not exclude those included feed URLs. Second, enabled URL expansion/text customisation may use other site pages or wording. Review listing groups, eligible URLs and generated assets separately. [G11, G13]

What does not follow automatically

A visible old item may be excluded, disapproved, expired or eligible only for free listings; its presence alone proves neither spend nor a penalty to current products. An ordinary keyword Search campaign is not automatically penalised because Merchant Centre contains old items. Direct feed effects chiefly concern Shopping and feed-connected PMax; separate Ads destination/healthcare enforcement can still affect Search.

No account metrics were available. This report does not quantify lost revenue, increased CPC, reduced ROAS or actual conversion-tracking loss.

6 Account checks and remediation sequence

1. Export current and obsolete listings together

Collect Merchant Centre item ID, source, last update, channel, language/country, destination eligibility, item-group ID, SKU/GTIN, title, image, link, price/sale price, availability and issue codes. Include processed attributes and automatic-update history. Join to the 22 current variants. Multiple countries or languages can legitimately produce more than 22 records; investigate unmatched identities instead of enforcing a crude record count.

2. Establish why an obsolete item persists

Check Shopify Google-channel publication, additional feeds/apps, previously generated IDs and automatically discovered products. These are possible causes, not observed Senseless faults. For each record choose keep, update, retire or investigate. Remove discontinued products from the submitting source so they are not recreated; exclude obsolete offers from active paid campaigns while the source is corrected. Preserve IDs for genuinely unchanged products. [G12]

3. Prove the ad impact

For every suspect ID, inspect Shopping eligibility, PMax/Shopping listing-group inclusion and 30/90-day impressions, clicks, cost, purchases and conversion value. Compare the advertised item with what the destination sells. Calculate wasted spend only where actual cost and a defensible definition of obsolete/misleading inventory exist. Check account-level issues separately from product-level issues.

4. Correct the confirmed website issues

Reconcile the strength-scale explanation against formulation evidence. Correct returns wording and align settings/schema. Validate existing assigned identifiers, model size variants explicitly where appropriate, and test advertised variant URLs for visible size, price, image, availability and add-to-cart selection. Confirm shipping at £39.99, £40, £79.99 and £80, including postcode coverage and dispatch cut-off behaviour.

5. Validate measurement without assumptions

Google measurement configuration and consent controls were present in inspected source. That does not prove correct purchase tracking, nor does absence of a visible AW tag prove it is broken. Test a purchase and refund against Shopify order records: transaction ID, value, currency, deduplication, primary conversion action and consent state. Check GA4-imported versus native Ads conversions, and avoid bidding to duplicate purchase actions.

6. Resubmit and monitor the actual outcomes

After fixing source data and any documented policy issues, resync and use the applicable review process. Track eligible current variants, obsolete active IDs, mismatch issue counts, item-level spend, conversion rate and ROAS. Compare equivalent periods allowing for attribution delay, promotions and campaign changes. A cleaner feed increases eligibility and consistency; it does not guarantee a specific uplift.

Completion criteria

Every paid offer maps to a current purchasable variant; processed attributes and landing pages agree; retired IDs cannot be resubmitted accidentally; shipping/returns are consistent; claims have supporting evidence; and one genuine order produces the intended purchase conversion and value.

7 Sources and audit boundaries

Sources were reviewed during this research on 20 September 2026. Website observations are a point-in-time snapshot. Links below are clickable. Source labels in the report distinguish site evidence from general platform mechanisms.
